

## SATPREP

### Assignment : Properties of curve : Implicit differentiation

- Show that the points  $(0, 0)$  and  $(\sqrt{2\pi}, -\sqrt{2\pi})$  on the curve  $e^{(x+y)} = \cos(xy)$  have a common tangent.
- The function  $f$  is defined by  $f(x) = e^{x^2-2x-1.5}$ .
  - Find  $f'(x)$ .
  - You are given that  $y = \frac{f(x)}{x-1}$  has a local minimum at  $x = a$ ,  $a > 1$ . Find the value of  $a$ .
- Find the gradient of the normal to the curve  $3x^2y + 2xy^2 = 2$  at the point  $(1, -2)$ .
- The quadratic function  $f(x) = p + qx - x^2$  has a maximum value of 5 when  $x = 3$ .
  - Find the value of  $p$  and the value of  $q$ .
  - The graph of  $f(x)$  is translated 3 units in the positive direction parallel to the  $x$ -axis. Determine the equation of the new graph.
- Find the equation of the normal to the curve  $5xy^2 - 2x^2 = 18$  at the point  $(1, 2)$ .
- A curve  $C$  is defined implicitly by  $xe^y = x^2 + y^2$ . Find the equation of the tangent to  $C$  at the point  $(1, 0)$ .
- Consider the curve with equation  $f(x) = e^{-2x^2}$  for  $x < 0$ .  
Find the coordinates of the point of inflexion and justify that it is a point of inflexion.
- The function  $f$  is defined on the domain  $x \geq 0$  by  $f(x) = \frac{x^2}{e^x}$ .
  - Find the maximum value of  $f(x)$ , and justify that it is a maximum.
  - Find the  $x$  coordinates of the points of inflexion on the graph of  $f$ .
- The function  $f$  is defined by  $f(x) = (\ln(x-2))^2$ . Find the coordinates of the point of inflexion of  $f$ .

10. The normal to the curve  $xe^{-y} + e^y = 1 + x$ , at the point  $(c, \ln c)$ , has a  $y$ -intercept  $c^2 + 1$ . Determine the value of  $c$ .
11. Find the equation of the normal to the curve  $x^3y^3 - xy = 0$  at the point  $(1, 1)$ .
12. Find the gradient of the curve  $e^{xy} + \ln(y^2) + e^y = 1 + e$  at the point  $(0, 1)$ .

## Solutions

1. Attempt at implicit differentiation

$$e^{(x+y)} \left( 1 + \frac{dy}{dx} \right) = -\sin(xy) \left( x \frac{dy}{dx} + y \right)$$

$$\text{let } x = 0, y = 0$$

$$e^0 \left( 1 + \frac{dy}{dx} \right) = 0$$

$$\frac{dy}{dx} = -1$$

$$\text{let } x = \sqrt{2\pi}, y = -\sqrt{2\pi}$$

$$e^0 \left( 1 + \frac{dy}{dx} \right) = -\sin(-2\pi) \left( x \frac{dy}{dx} + y \right) = 0$$

$$\text{so } \frac{dy}{dx} = -1$$

since both points lie on the line  $y = -x$  this is a common tangent

**Note:**  $y = -x$  must be seen for the final R1. It is not sufficient to note that the gradients are equal.

2. (a)  $\left( u = x^2 - 2x - 1.5; \frac{du}{dx} = 2x - 2 \right)$

$$\frac{df}{dx} = \frac{df}{du} \frac{du}{dx} = e^x (2x - 2)$$
$$= 2(x - 1) e^{x^2 - 2x - 1.5}$$

(b)  $\frac{dy}{dx} = \frac{(x-1) \times 2(x-1) e^{x^2 - 2x - 1.5} - 1 \times e^{x^2 - 2x - 1.5}}{(x-1)^2}$

$$= \frac{2x^2 - 4x + 1}{(x+1)^2} e^{x^2 - 2x - 1.5}$$

minimum occurs when  $\frac{dy}{dx} = 0$

$$x = 1 \pm \sqrt{\frac{1}{2}} \left( \text{accept } x = \frac{4 \pm \sqrt{8}}{4} \right)$$

$$a = 1 + \sqrt{\frac{1}{2}} \left( \text{accept } a = \frac{4 + \sqrt{8}}{4} \right)$$

3. Attempting to differentiate implicitly

$$3x^2y + 2xy^2 = 2 \Rightarrow 6xy + 3x^2 \frac{dy}{dx} + 2y^2 + 4xy \frac{dy}{dy} = 0$$

Substituting  $x = 1$  and  $y = -2$

$$-12 + 3 \frac{dy}{dx} + 8 - 8 \frac{dy}{dx} = 0$$

$$\Rightarrow -5 \frac{dy}{dx} = 4 \Rightarrow \frac{dy}{dx} = -\frac{4}{5}$$

Gradient of normal is  $\frac{5}{4}$

4. (a) **METHOD 1**

$$f'(x) = q - 2x = 0$$

$$f'(3) = q - 6 = 0$$

$$q = 6$$

$$f(3) = p + 18 - 9 = 5$$

$$p = -4$$

**METHOD 2**

$$f(x) = -(x-3)^2 + 5$$

$$= -x^2 + 6x - 4$$

$$q = 6, p = -4$$

(b)  $g(x) = -4 + 6(x-3) - (x-3)^2 (= -31 + 12x - x^2)$

**Note:** Accept any alternative form that is correct.

Award M1A0 for a substitution of  $(x+3)$ .

5.  $5y^2 + 10xy \frac{dy}{dx} - 4x = 0$

**Note:** Award A1A1 for correct differentiation of  $5xy^2$ .

A1 for correct differentiation of  $-2x^2$  and 18.

At the point  $(1, 2)$ ,  $20 + 20 \frac{dy}{dx} - 4 = 0$

$$\Rightarrow \frac{dy}{dx} = -\frac{4}{5}$$

Gradient of normal =  $\frac{5}{4}$

Equation of normal  $y - 2 = \frac{5}{4}(x - 1)$

$$y = \frac{5}{4}x - \frac{5}{4} + \frac{8}{4}$$

$$y = \frac{5}{4}x + \frac{3}{4} \quad (4y = 5x + 3)$$

6.  $xe^y = x^2 + y^2$   
 $e^y + xe^y \frac{dy}{dx} = 2x + 2y \frac{dy}{dx}$   
 $(1, 0)$  fits  $\Rightarrow 1 + \frac{dy}{dx} = 2 + 0$

$$\Rightarrow \frac{dy}{dx} = 1$$

Equation of tangent is  $y = x + c$

$$(1, 0) \text{ fits } \Rightarrow c = -1$$

$$\Rightarrow y = x - 1$$

7. .

$$f'(x) = -4x e^{-2x^2}$$

$$f''(x) = -4e^{-2x^2} + 16x^2 e^{-2x^2} \quad (= (16x^2 - 4)e^{-2x^2})$$

Attempting to solve  $f''(x) = 0$

$$x = -\frac{1}{2}$$

**Note:** Do not award this A1 for stating  $x = \pm \frac{1}{2}$  as the final answer for  $x$ .

$$f\left(-\frac{1}{2}\right) = \frac{1}{\sqrt{e}} (= 0.607)$$

**Note:** Do not award this A1 for also stating  $\left(\frac{1}{2}, \frac{1}{\sqrt{e}}\right)$  as a coordinate.

**EITHER**

Correctly labelled graph of  $f'(x)$  for  $x < 0$  denoting the maximum  $f'(x)$

(e.g.  $f'(-0.6) = 1.17$  and  $f'(-0.4) = 1.16$  stated)

**OR**

Correctly labelled graph of  $f''(x)$  for  $x < 0$  denoting the maximum  $f''(x)$

(e.g.  $f''(-0.6) = 0.857$  and  $f''(-0.4) = -1.05$  stated)

**OR**

$f'(0.5) \approx 1.21$ .  $f'(x) < 1.21$  just to the left of  $x = -\frac{1}{2}$

and  $f'(x) < 1.21$  just to the right of  $x = -\frac{1}{2}$

(e.g.  $f'(-0.6) = 1.17$  and  $f'(-0.4) = 1.16$  stated)

**OR**

$f''(x) > 0$  just to the left of  $x = -\frac{1}{2}$  and  $f''(x) < 0$  just to the right

of  $x = -\frac{1}{2}$

(e.g.  $f''(-0.6) = 0.857$  and  $f''(-0.4) = -1.05$  stated)

8. (a)  $f(x) = \frac{2xe^x - x^2e^x}{e^{2x}} \left( = \frac{2x - x^2}{e^x} \right)$

For a maximum  $f'(x) = 0$

$$2x - x^2 = 0$$

giving  $x = 0$  or  $2$

$$f''(x) = \frac{(2-2x)e^x - e^x(2x-x^2)}{e^{2x}} \left( = \frac{x^2 - 4x + 2}{e^x} \right)$$

$$f''(0) = 2 > 0 \Rightarrow \text{minimum}$$

$$f''(2) = -\frac{2}{e^2} < 0 \Rightarrow \text{maximum}$$

$$\text{Maximum value} = \frac{4}{e^2}$$

(b) For a point of inflexion,

$$f''(x) = \frac{x^2 - 4x + 2}{e^x} = 0$$

$$\text{giving } x = \frac{4 \pm \sqrt{16-8}}{2}$$

$$= 2 \pm \sqrt{2}$$

$$\begin{aligned}
 \text{(c)} \quad \int_0^1 x^2 e^{-x} dx &= \left[ -x^2 e^{-x} \right]_0^1 + 2 \int_0^1 x e^{-x} dx \\
 &= -e^{-1} - 2 \left[ x e^{-x} \right]_0^1 + 2 \int_0^1 e^{-x} dx \\
 &= -e^{-1} - 2e^{-1} - 2 \left[ e^{-x} \right]_0^1 \\
 &= -3e^{-1} - 2e^{-1} + 2 \quad (= 2 - 5e^{-1})
 \end{aligned}$$

$$\begin{aligned}
 \text{9.} \quad f(x) &= \frac{2(\ln(x-2))}{x-2} \\
 f'(x) &= \frac{(x-2) \left( \frac{1}{x-2} \right) - 2 \ln(x-2) \times 1}{(x-2)^2} \\
 &= \frac{2 - 2 \ln(x-2)}{(x-2)^2}
 \end{aligned}$$

$f''(x) = 0$  for point of inflexion

$$\Rightarrow 2 - 2 \ln(x-2) = 0$$

$$\ln(x-2) = 1$$

$$x - 2 = e$$

$$x = e + 2$$

$$\Rightarrow f(x) = (\ln(e + 2 - 2))^2 = (\ln e)^2 = 1$$

( $\Rightarrow$  coordinates are  $(e + 2, 1)$ )

## 10. EITHER

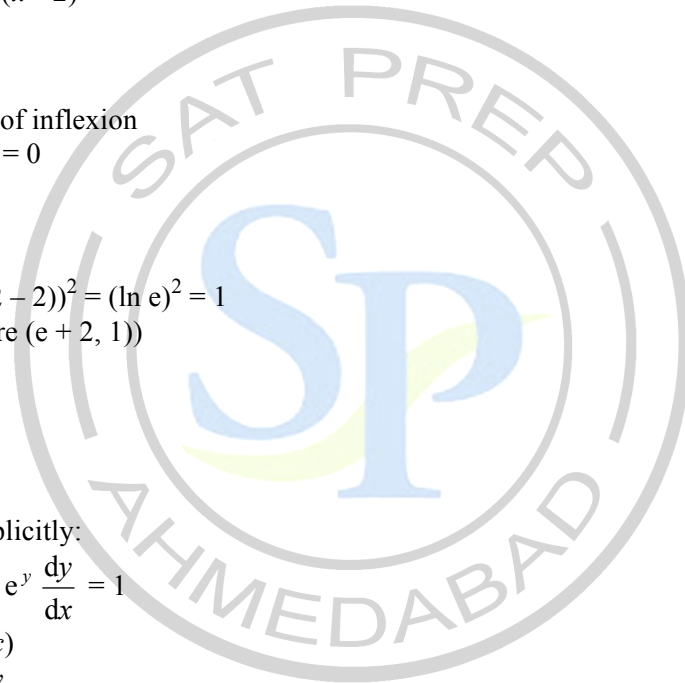

differentiating implicitly:

$$1 \times e^{-y} - x e^{-y} \frac{dy}{dx} + e^y \frac{dy}{dx} = 1$$

at the point  $(c, \ln c)$

$$\frac{1}{c} - c \times \frac{1}{c} \frac{dy}{dx} + c \frac{dy}{dx} = 1$$

$$\frac{dy}{dx} = \frac{1}{c} \quad (c \neq 1)$$

**OR**

reasonable attempt to make expression explicit

$$xe^{-y} + e^y = 1 + x$$

$$x + e^{2y} = e^y(1 + x)$$

$$e^{2y} - e^y(1 + x) + x = 0$$

$$(e^y - 1)(e^y - x) = 0$$

$$e^y = 1, e^y = x$$

$$y = 0, y = \ln x$$

**Note:** Do not penalize if  $y = 0$  not stated.

$$\frac{dy}{dx} = \frac{1}{2}$$

$$\text{gradient of tangent} = \frac{1}{c}$$

**Note:** If candidate starts with  $y = \ln x$  with no justification, award (M0)(A0)A1A1.

**THEN**

the equation of the normal is

$$y - \ln c = -c(x - c)$$

$$x = 0, y = c^2 + 1$$

$$c^2 + 1 - \ln c = c^2$$

$$\ln c = 1$$

$$c = e$$

11.  $x^3y^3 - xy = 0$   
 $3x^2y^3 + 3x^3y^2y' - y - xy' = 0$

**Note:** Award A1 for correctly differentiating each term.

$$x = 1, y = 1 \quad 3 + 3y' - 1 - y' = 0$$
$$2y' = -2$$
$$y' = -1$$

gradient of normal = 1

$$\text{equation of the normal } y - 1 = x - 1$$
$$y = x$$

12.  $e^{xy} + \ln(y^2) + e^y = 1 + e$

$$e^{xy} \left( y + x \frac{dy}{dx} \right) + \frac{2}{y} \frac{dy}{dx} + e^y \frac{dy}{dx} = 0, \text{ at } (0, 1)$$

$$1(1 + 0) + 2 \frac{dy}{dx} + e \frac{dy}{dx} = 0$$

$$1 + 2 \frac{dy}{dx} + e \frac{dy}{dx} = 0$$

$$\frac{dy}{dx} = -\frac{1}{2+e} (= -0.212)$$
